

The Fundamentals of the Future International Emissions Trading System

Loreta Stankeviciute, LEPII-EPE

Alban Kitous, ENERDATA

Patrick Criqui, LEPII-EPE

Problematique

- ◆ **The European Emissions Trading System (ETS) constitutes the basis for the future international carbon market**
- ◆ **The dynamics of its fundamentals will dictate the future price of carbon, according to three sets of variables:**
 - **Emissions reduction constraints (cf. reduction objectives of the European Council, March 8-9, 2007)**
 - **Market configuration (i.e. its geographical extension)**
 - **New flexibility margins provided by a longer time-period for the adjustment of investments**

Introduction

◆ Importance

- Emissions trading system assures the least cost allocation (in theory)
- ETS will continue after 2012...
- ETS integrates the credits from the Kyoto project based-mechanisms: CDM and JI
- CO2 price estimation becomes a key risk-management issue for the utility analysts ...and the financial analysts

◆ Problems

- Uncertainty of CO2 price
- Lack of sectoral analysis
- Lack of analysis representing different carbon market configurations

◆ Methodology

- Emissions quota allocations ← PNAQ, UNFCCC, EIA, POLES
- MACC ← POLES
- CO2 market analysis ← ASPEN

◆ Conclusion

- The benefits of an extended carbon market gain importance in 2020 and the new flexibility margins provided by a longer time-period for the adjustment of investments compensates for the increasing pressure towards stronger emission reductions

Methodology : sectoral allocations

- ◆ Global carbon market : EU25, rest of Annex B countries, non-Annex B countries
- ◆ EU25 – 12 sectors; other countries – 4 sectors
- ◆ Base year emissions : data from UNFCCC, EIA
- ◆ Quotas 2010 : Kyoto objectives
- ◆ Quotas 2020 : reduction of 20% of CO2 emissions (Council proposed 20% reduction of GHG emissions)

Sectoral Distribution

- ◆ From 2nd NAPs, national GHG emissions inventories and POLES

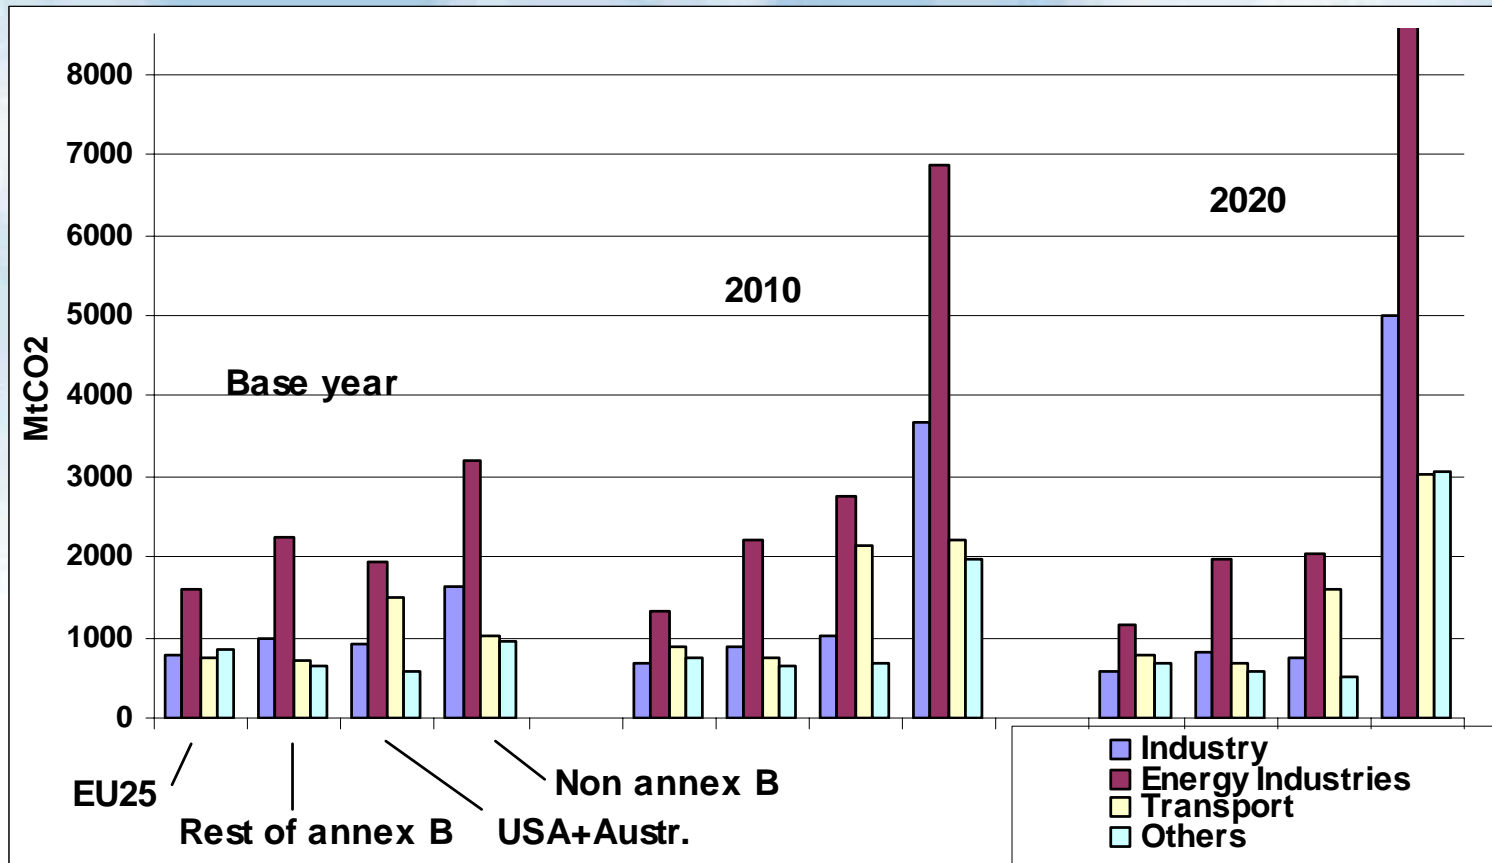

Sub-sectoral allocations ← UE25

| | Base year | 2004 | Kyoto | 2020 | Difference | | | | | | | | |
|-----------|--------------------------------|-------------|-------------|-------------|-------------------|-------------|------------------|-------------|--------------|-------------|-------------|-------------|-------------|
| | | | | | (base year-Kyoto) | | (base year-2020) | | (2004-Kyoto) | | (2004-2020) | | |
| | | | | | Mt CO2 | % | Mt CO2 | % | Mt CO2 | % | Mt CO2 | % | |
| | | | | | <i>Mt CO2</i> | | | | | | | | |
| Industry | Chemistry | 128 | 106 | 86 | 76 | -42 | -33 | -52 | -41 | -20 | -19% | -30 | -28% |
| | Ferrous metals | 222 | 151 | 221 | 196 | -1 | 0 | -26 | -12 | 70 | 46% | 45 | 30% |
| | Minerals | 330 | 289 | 281 | 255 | -49 | -15 | -75 | -23 | -7 | -2% | -34 | -12% |
| | Others | 102 | 103 | 79 | 69 | -23 | -22 | -33 | -32 | -24 | -23% | -34 | -33% |
| | <i>Total Industry</i> | 782 | 649 | 668 | 596 | -115 | -15 | -186 | -24 | 19 | 3% | -53 | -8% |

| | Others | 107 | 77 | 87 | 74 | -20 | -19 | -33 | -31 | 10 | 13% | -3 | -4% |
| | <i>Total Others</i> | 834 | 738 | 754 | 650 | -79 | -10 | -184 | -22 | 16 | 2% | -88 | -12% |
| | <i>Total Energy</i> | 3963 | 3833 | 3633 | 3171 | -331 | -8 | -792 | -20 | -200 | -5% | -662 | -17% |

◆ According to our CO2 allocation assumptions:

- the most important reduction in quantity is achieved electricity sub-sector in 2010 and 2020;
- the most important increase in quantity is for road transport in 2010 and 2020 relative to 1990 emission levels;
- the allocation is generous for European Industry of ferrous metals relative to 2004 emissions levels.

Sectoral allocation ← the world

◆ According to our CO2 allocation assumptions:

- The global CO2 emissions increase by 45% in 2010 and by 58% in 2020 relative to the base year level 1990;
- Non-Annex B countries responsible for the increase.

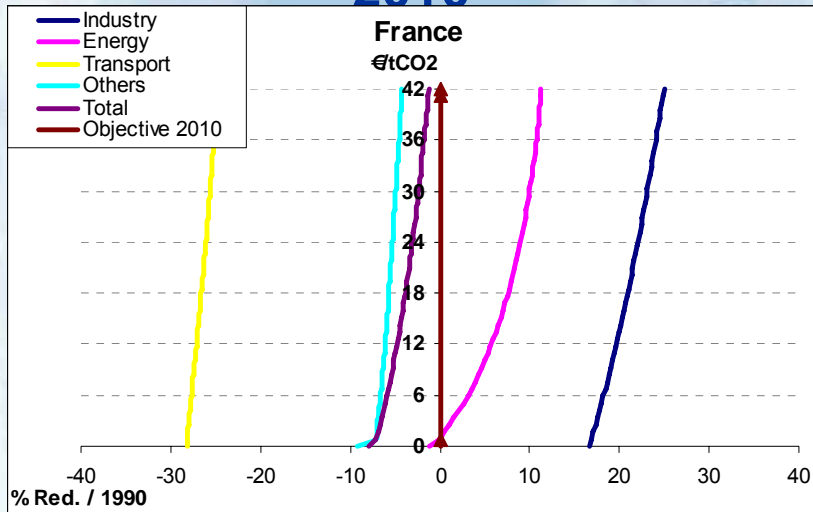

Methodology : MAC curves ← POLES

- ◆ Linear carbon tax is introduced in the successive simulations of the Reference scenario (without carbon policies)
- ◆ The “final” tax varies from 0 to 125 €/tCO₂, by step of 2,5 €/tCO₂
- ◆ MACCs are produced at sectoral and country/region level:

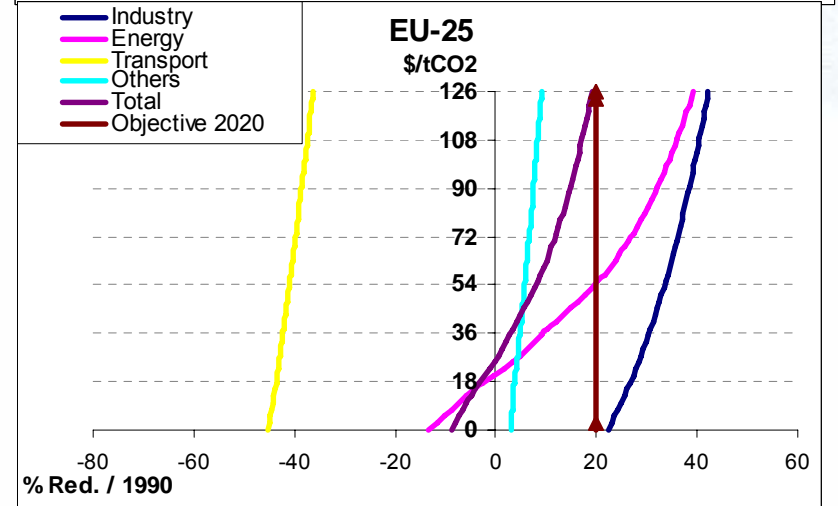

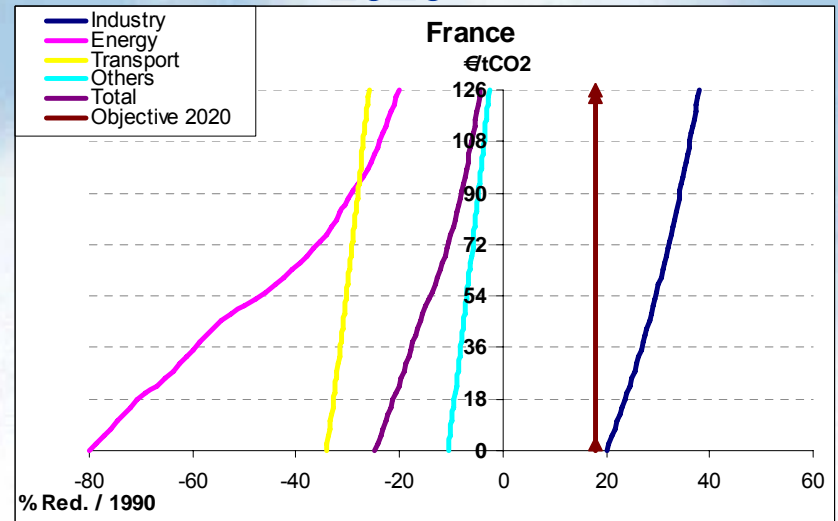

Sectoral MACCs

2010

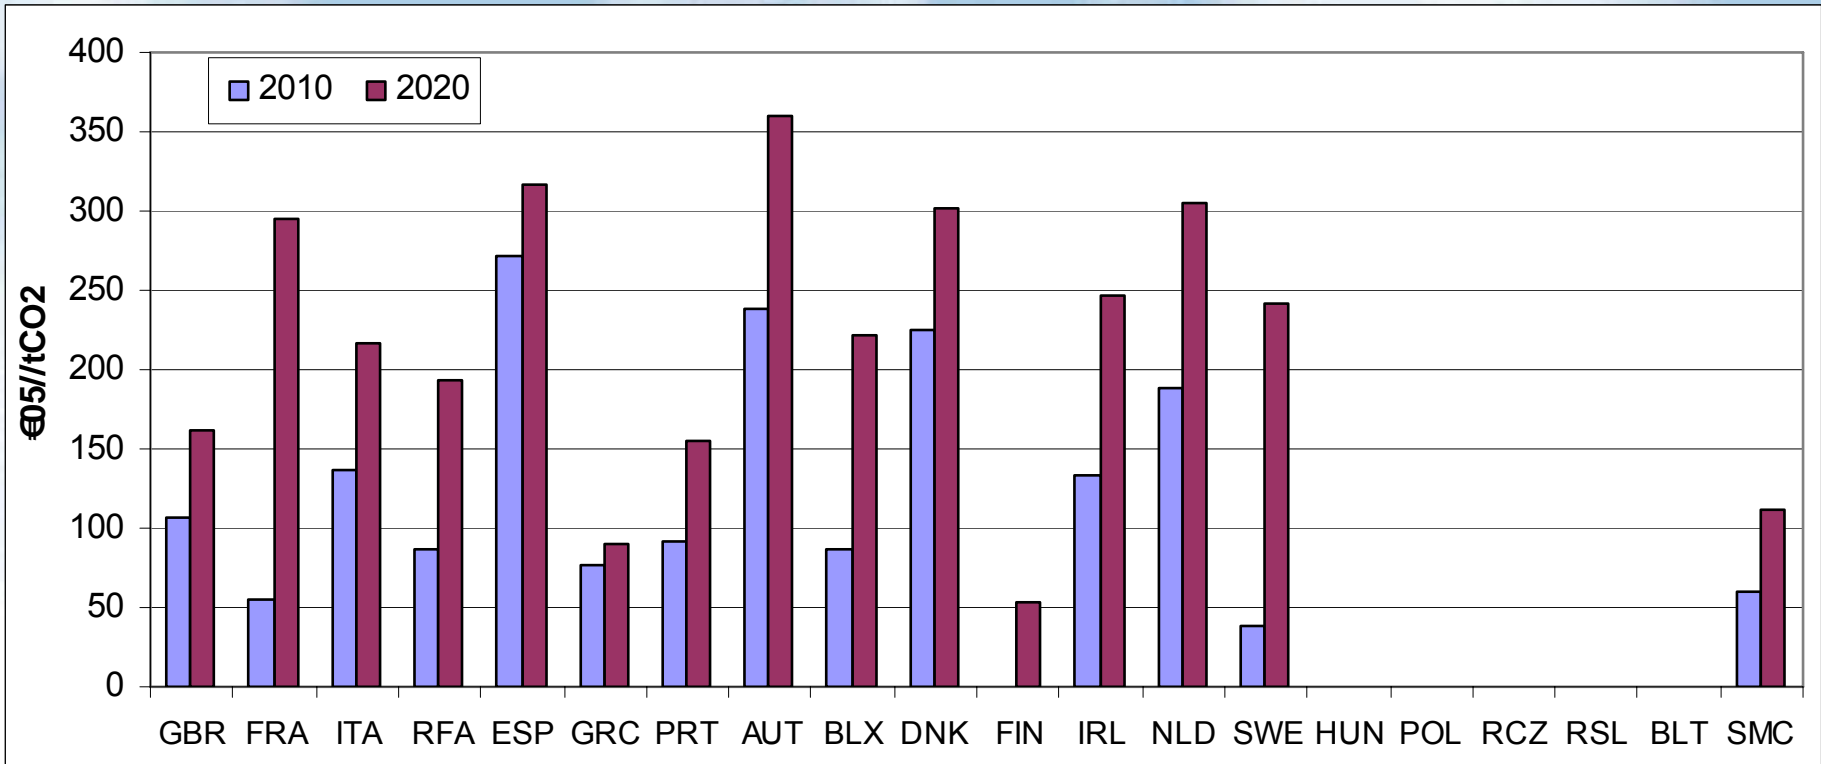

2020

- ◆ Electricity sector presents high elasticity to the carbon price
- ◆ Zero cost reduction in the Industry sector

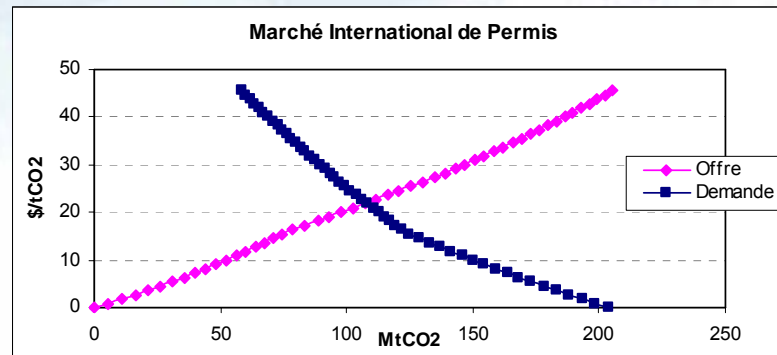

National MAC

- ◆ Highest MAC : Spain and Austria
- ◆ Allowance trade profit new member countries

Supply and demand on the CO2 market ← ASPEN

- ◆ Aggregation of MACCs from POLES for the participating sectors by country
- ◆ Definition of supply and demand on the CO2 market in function of the allocations of emissions by country/sectors
- ◆ Calculation of the corresponding equilibrium price

- ◆ Determination of the purchases / sales by country / sector and of the national reduction costs with and without the exchange

Configuration / size of the CO2 market

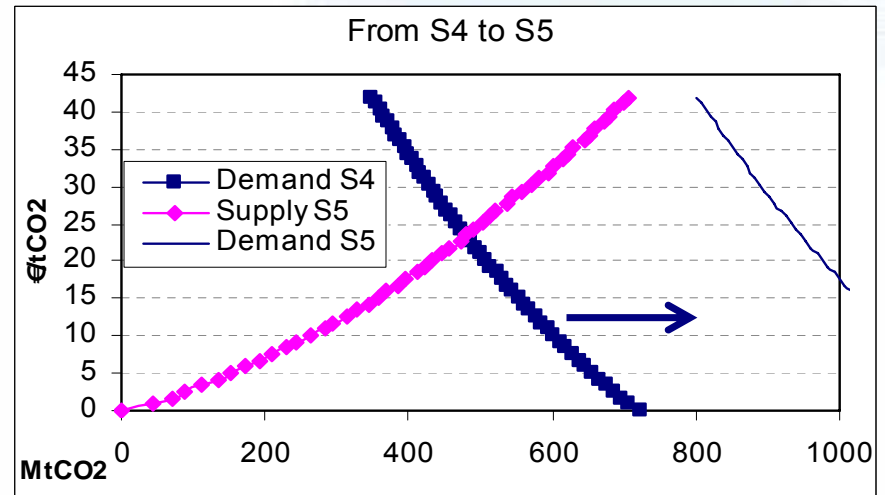

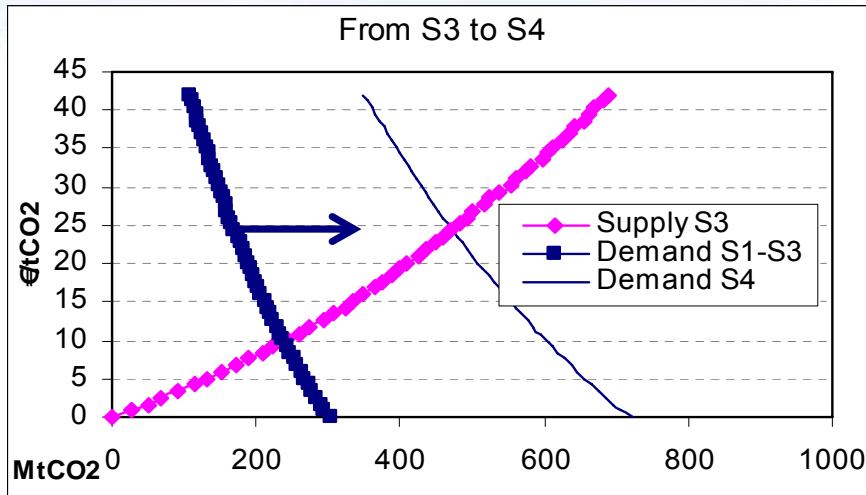

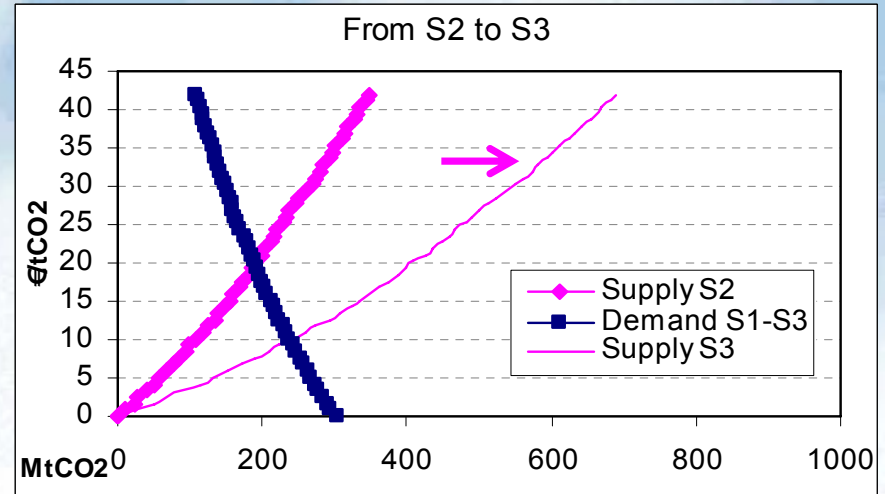

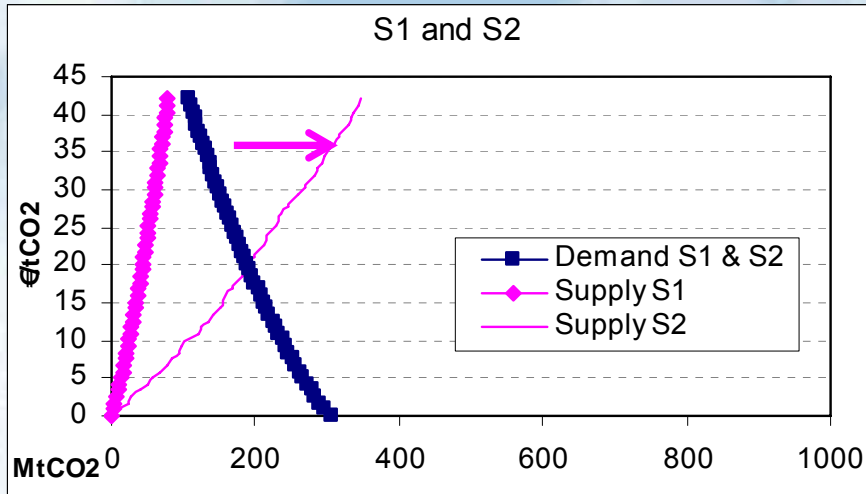

◆ Different carbon market configurations / scenarios

| Countries / Regions | EU 25 | Opening to CDM non-Annex B | Opening to JI Russia, Ukraine, Bulgaria, Romania, RCEU* | Inclusion of Rest Annex B | All countries |
|------------------------|-----------------------------|----------------------------|---|---------------------------|--------------------|
| <i>Trading Sectors</i> | <i>industry+electricity</i> | | | | <i>all sectors</i> |
| <i>Scenarios</i> | | | | | |
| S1 | V | | | | |
| S2 | V | V | | | |
| S3 | V | V | V | | |
| S4 | V | V | V | V | |
| S5 | V | V | V | V | V |

◆ Variants for 2 variables:

1. CDM potential: 15% in 2010 and 2020
2. “Hot air” presence : either 0 or 50% en 2010
: either 0 or 100% en 2020

Carbon market analysis in 2010

Carbon market analysis and the CO₂ price in 2010 and 2020

- ◆ In the short term, CO₂ price is influenced by “hot air”
- ◆ CO₂ price in 2020 not extremely high: longer time period provides smoother adjustment in less polluting capital

Results: scenario 2 for 2010

| | Reduction objectives, MtCO2 | | Domestic reduction, MtCO2 | | Sales / Purchases of CO2 allowances, MtCO2 | | Domestic costs without trading, M€ | Domestic costs with trading, M€ |
|--------------------|-----------------------------|----------|---------------------------|----------|--|----------|------------------------------------|---------------------------------|
| | Electricity | Industry | Electricity | Industry | Electricity | Industry | | |
| EU25 | | | | | | | | |
| France | 10 | 0 | 8 | 0 | 2 | 0 | 113 | 109 |
| Germany | 69 | 0 | 34 | 4 | 35 | -4 | 1345 | 972 |
| UK | 60 | 9 | 12 | 4 | 47 | 5 | 3405 | 1198 |
| Italy | 6 | 13 | 5 | 3 | 1 | 10 | 471 | 294 |
| Rest of Europe | 116 | 16 | 73 | 9 | 43 | 7 | 6096 | 1740 |
| <i>Total EU 25</i> | 261 | 39 | 133 | 21 | 128 | 18 | 11429 | 4312 |
| CDM | | | | | | | | |
| China | | | 49 | 26 | 51% | 50% | | -850 |
| India | | | 13 | 5 | 14% | 11% | | -200 |
| Rest Asia | | | 16 | 7 | 17% | 13% | | -238 |
| Latin America | | | 2 | 3 | 2% | 6% | | -17 |
| Africa+Middle East | | | 12 | 9 | 12% | 17% | | -231 |
| Turkey | | | 3 | 1 | 3% | 3% | | -50 |
| <i>Total CDM</i> | | | 95 | 51 | -95 | -51 | | -1587 |

- ◆ 49% of the European deficit in ETS in 2010 is covered by the CDM credits, 51% by domestic reduction measures
- ◆ The deficit is modest for Industry sector; the domestic reductions are greater than the credits purchases
- ◆ The reduction burden belongs to the electricity sector
- ◆ Asia supplies 81% of the CDM credits

Results: scenario 4 for 2020

| | | Reduction objectives, MtCO2 | | Domestic reduction, MtCO2 | | Sales / Purchases of CO2 allowances, MtCO2 | | Domestic costs without trading, M€ | Domestic costs with trading, M€ |
|---------------------------|--------------------|-----------------------------|----------|---------------------------|----------|--|----------|------------------------------------|---------------------------------|

| ex JI | Russia | 0 | 0 | 232 | 52 | -95% | -56% | 0 | -5998 |
| | <i>Total ex JI</i> | | 152 | 6 | 396 | 99 | -244 | -93 | 1356 |

- ◆ Carbon market reduces reduction costs in all countries; by more than a factor of 2 in France, Canada, close to a factor of 2 in Japan

Conclusion

- ◆ The reduction burden weights heavily on the electricity sector
- ◆ At the same time, the electricity sector is the most flexible according to the MACCs analysis
- ◆ Weak reduction targets along with low MACs prevail in industry sectors
- ◆ The CO₂ price in 2010 is very sensitive to “hot air”
- ◆ Without the CDM credits, the CO₂ price in 2010 would be 46€/tCO₂ in
- ◆ The benefits of enlarged carbon market increase in 2020 since more than half of the reductions should be achieved in ETS sectors
